VORLDX INDUSTRIES PVT LTD

Employee Attendance System

Project Idea & Requirements

A project brief for the VorldX internship team.

1. Project Overview

TheVorldX Employee Attendance System is a company attendance solution with two user-facing applications: the **VorldX Employee Website** for HR/Admin and the **VorldX Employee App** for employees. It is intended to make daily attendance, employee attendance records, and attendance administration clear and convenient.

The system manages employee attendance-related records, policies, and workflows, with a verification process for employee accounts.

2. Project Components

VorldX Employee Website	The HR/Admin website for employee attendance information, attendance policies, WFH requests, attendance records, and reporting.
VorldX Employee App	The employee mobile app for account verification, QR-based attendance, WFH requests where eligible, and personal attendance history and statistics.
Office QR Display	A dedicated office screen showing a dynamic QR code that employees scan to record office attendance. It is a supporting system component, not a third application.

Employee account and verification

- Employees register using their assigned employee ID.
- Use dummy employee data and mock verification responses during development and demonstration.
- The demo verification flow should show how account verification works without requiring real employee records or real email delivery.
- The website, mobile app, QR display, and attendance flows should be demonstrable end-to-end using clearly identified sample data.
- First-time account verification can be demonstrated with a simulated OTP flow.

Office attendance

- Employees check in and check out by scanning the dynamic QR code shown on the office QR display.
- QR codes are short-lived and rotate periodically to demonstrate the intended attendance flow.
- Attendance times and status are recorded according to company attendance rules.
- Late attendance is determined using the configured work schedule and grace period.

Work From Home (WFH)

- Employees can view WFH eligibility and submit a request where permitted.
- Requests can include a date and reason where required.
- Employees can view pending, approved, and rejected request statuses.
- WFH attendance and approvals follow company policy.

Employee attendance information

- View today's attendance status, check-in/check-out times, and duration where available.
- Review attendance history and relevant records.
- View personal statistics such as present days, late days, WFH days, and attendance percentage.
- View profile and attendance-related information.

HR/Admin capabilities

- Manage sample employee records and attendance-related details such as department, designation, shift, work type, and joining date.
- Manage attendance policies and applicable WFH policies.
- Review and approve or reject WFH requests.
- View, filter, and manage attendance records, including permitted corrections.
- Manage office QR display pairing and availability.
- Access attendance reports and audit records.

4. Full-Stack Project Requirement

The project must be a working full-stack application?not just a frontend prototype. It must include and connect all three layers: frontend, backend, and database.

- Frontend: the employee website, employee mobile app, and supporting QR display interface.
- Backend: application APIs and business logic for account verification demos, attendance, QR validation, WFH requests, attendance policies, and HR/Admin operations.
- Database: persistent storage for sample employees, attendance records, WFH requests, policies, QR display details, and relevant audit records.
- The frontend, backend, and database must work together so actions performed in the website or app are reflected in the system, rather than being only static screens.
- Use dummy data and simulated verification where real integrations are not available. Clearly identify demo data and do not use real employee personal information.

5. User Experience & Visual Requirements

The website and app should have a modern, premium visual identity with the quality expected of a contemporary technology product.

- Modern, clean, responsive, and mobile-first interfaces.
- Cool colors and controlled gradients, including blue, cyan, indigo, and violet accents.
- Smooth, purposeful animations and subtle micro-interactions.
- Premium cards, clear typography, thoughtful spacing, and strong visual hierarchy.
- Selective glassmorphism where it improves the design.
- Clear loading, success, empty, and error states.
- Easy to understand and not visually cluttered.

6. Initial Scope Exclusions

The initial project is focused on attendance and related employee information. It does not include:

- GPS or location-based tracking.
- Wi-Fi or Bluetooth proximity attendance.
- Facial recognition, fingerprint, or other biometric attendance.
- Payroll or a complete HR management system.
- Complex leave management or employee ranking.
- Advanced manager workflows and other future-phase features.

7. Project Report Requirement

A project report must be prepared and submitted with the completed project. It should explain the work carried out during development in a clear and organized manner.

- Project overview, goals, and requirements.
- Features implemented in the website, mobile app, and QR display.
- Frontend, backend, and database architecture and how the parts interact.
- Database design and the main data entities used.
- Important application flows, including demo verification, QR attendance, check-in/check-out, and WFH.
- Dummy data and simulated services used for the demonstration.
- Screenshots of the main screens and important working flows.
- Testing performed, issues found, and limitations or features not completed.

8. Key Requirements & Principles

- Demo-first verification: use dummy data and simulated verification so the full experience can be demonstrated.
- Full-stack implementation: frontend, backend, and database must be connected and functional together.
- Backend-controlled decisions: attendance validity and status are determined by backend logic and company rules, even when the demo uses sample data.
- Two user-facing applications: VorldX Employee Website and VorldX Employee App. The office QR display is a supporting attendance component.
- Privacy-focused scope: clearly identify sample data and do not use real employee personal information.

PROJECT GOAL

A working full-stack attendance system with a modern VorldX experience, demonstrated end-to-end using dummy data and accompanied by a project report.
